Problem Statement

The student organization PUCSSA holds a talent competition every year. The host needs an electronic managing system to record scores for the competition.

Project Objectives

We will create a managing system for PUCSSA's talent competition consisting of several rounds, in which each contestant will show his or her talent in different fields such as singing and dancing. The system will allow contestants to view their qualification, schedule of competitions, and scores. It will also allow judges to manage the schedule of each competition, to assign qualified contestants to next round, and to easily review the final results.

Stakeholders

Judges and contestants in talent competitions.

Project Deliverables

An electronic managing system for talent competition based on an oracle database implemented as a Java desktop application. The application will provide user with a graphical interface, and will respond to user operation by querying and interpreting the database. The executable program is a jar file that could be run in any platform with JRE installed.
